

INSIGHT SUMMARY Spotify Global Chart 2024 – Exploratory Data Analysis

1. Project Overview

This project analyzes the Spotify Global Top 200 dataset for the year 2024 to understand music popularity patterns, artist dominance, and chart dynamics. The analysis focuses on descriptive statistics and exploratory data analysis without applying predictive models.

Dataset: 10,600 weekly records from Spotify Global Charts 2024.

2. Key Insights

Insight 1: Stream Distribution

The distribution of streams is heavily right-skewed, indicating that a small number of songs account for a disproportionately large share of total streams.

Insight 2: Rank and Streams Relationship

Songs with higher chart positions generally receive more streams, although some exceptions suggest the influence of viral trends and external promotion.

Insight 3: Artist Dominance

A limited group of artists appears frequently in the charts, reflecting strong brand presence and sustained popularity.

Insight 4: Chart Longevity

Most songs remain on the chart for a short period, while only a few achieve long-term stability across multiple weeks.

Insight 5: New Entries

Newly released songs represent a smaller portion of the chart, indicating high competition and barriers to entry.

3. Conclusion

Spotify Global Chart 2024 demonstrates a highly competitive environment dominated by hit songs and established artists. Exploratory analysis provides valuable insights into user listening behavior and market dynamics.

4. Limitations and Future Work

This analysis does not include audio features from the Spotify API. Future work may integrate audio characteristics and time-series analysis.
